TWO COLUMNS / FORMULAS

Two-column document review

ORIGINAL INPUT / not a translated model output

1. Experiment setup

The device observes six runs per condition.

The mean score follows equation (1).

```
x_bar=(x1+...+xn)/n  (1)
```

n = 6; measurement unit = C

2. Results and limitations

The sample is illustrative and does not represent a benchmark.

Equation (2) measures the absolute residual.

```
r=abs(y-y_hat)  (2)
```

n = 6; measurement unit = C
